Definations

Two Dimensional Arrays Expression

To describe variants of two-dimensional arrays we write $(b: k \mapsto j \mapsto x)$ instead of $(b: k \mapsto (b[k]: j \mapsto x))$. We use this new notation to state an instance of the array-assignment axiom we saw already

$$\left\{\phi[^{(b:k\mapsto x)}/_b]\right\}b[k] := x\left\{\phi\right\}$$

for two-dimensional arrays:

$$\{\phi^{[(b:k\mapsto j\mapsto x)/b]}\}b[k][j] := x\{\phi\}$$

String Length

A string $S \in Letter^*$ which is an array of letters¹. Also, string will be terminate by the null character which is a convention by the C programming language and we will follow this convention in this proof. We write |S| for the number of letters in the string. Formally, we define these two nothion inductively by

$$|S\ell| = |S| + \begin{cases} 1 & \text{if } \ell \neq' \setminus 0' \\ 0 & \text{if } \ell =' \setminus 0' \end{cases}$$

Also, by the convention of C we has this definition for $S \in string$.

$$S[|S|] = ' \setminus 0' \land \forall 0 \le i < |S| (S[i] \ne ' \setminus 0')$$

¹The letter here is a legal charater encode with ASCII, UTF-8 or other charater encoding standard.

String Equals

To describe two string $a, b \ (a, b \in String)$ are equals we write a = b when:

$$a = b \iff |a| = |b| \land \forall j \in 0.. |a| (a[j] = b[j])$$

Similarly, we write:

$$a \neq b \iff \neg(a = b)$$

String Assign

To assign a string to another string array, we will denote as

$$a := b$$

instead of a long programme of our toy language:

```
 \begin{aligned} & \{a,b \in String\} \\ & \{I[^0/i]\} \\ & i := 0; \\ & \{I\} \\ & \text{while } i \leq |b| \text{ do } \\ & \{I \wedge i \leq |b|\} \\ & \{I[^{i+1}/_i][^{a:i \mapsto b[i]}/_a]\} \\ & a[i] := b[i]; \\ & \{I[^{i+1}/_i]\} \\ & i := i+1; \\ & \{I\} \\ & \text{od}; \\ & \{I \wedge i > |b|\} \\ & \{a,b \in String \wedge a = b\} \end{aligned}
```

when our invariant is

$$I = a, b \in String \land 0 \le i \le (|b| + 1) \land \forall k \in 0..(i - 1) (a[k] = b[k])$$

Here are the proofs of the implications:

First Implication for String assign: $a, b \in String \Rightarrow I[0/i]$

```
a,b \in String
\Rightarrow \quad \langle \text{using } |b| \in \mathbb{N} \text{ and realising that the last conjunct is vacuously true} \rangle
a,b \in String \land 0 \leq 0 \leq (|b|+1) \land \forall k \in 0..(0-1) (a[k]=b[k])
\Leftrightarrow \quad \langle \text{definition of I and substitution} \rangle
I[^0/_i]
```

Second Implication $I \wedge i \leq |b| \Rightarrow I[i+1/i][a:i\mapsto b[i]/a]$

We first look at the LHS:

$$I \wedge i \leq |b|$$
 $\Leftrightarrow \quad \langle \text{Substitue I} \rangle$
 $a, b \in String \wedge 0 \leq i \leq (|b|+1) \wedge \forall k \in 0..(i-1) (a[k] = b[k]) \wedge i \leq |b|$
 $\Leftrightarrow \quad \langle \text{Conjunct } i \leq (|b|+1) \text{ and } i \leq |b| \rangle$
 $a, b \in String \wedge 0 \leq i \leq |b| \wedge \forall k \in 0..(i-1) (a[k] = b[k])$

We then expand RHS:

$$I[^{i+1}/_i][^{a:i\mapsto b[i]}/_a] \Leftrightarrow \quad \langle \text{substitute } i=i+1 \text{ and } a[i]=b[i] \text{ by definition} \rangle$$

$$a,b \in String \land 0 \leq i+1 \leq (|b|+1) \land \forall k \in 0..((i+1)-1) (a[k]=b[k]) \land a[i]:=b[i]$$

We then have a clear imply

$$a, b \in String \land 0 \le i \le |b| \land \forall k \in 0..(i-1) (a[k] = b[k])$$

 $\Rightarrow \quad \langle i \le |b| \Rightarrow i+1 \le |b|+1 \text{ and } a[i] := b[i] \rangle$
 $a, b \in String \land 0 \le i+1 \le (|b|+1) \land \forall k \in 0..((i+1)-1) (a[k] = b[k]) \land a[i] := b[i]$

Third Implication $I \wedge i > |b| \Rightarrow a, b \in String \wedge a = b$

$$I \wedge i > |b|$$
 $\Leftrightarrow \quad \langle \text{substitution of I } \rangle$
 $a, b \in String \wedge 0 \le i \le (|b|+1) \wedge \forall k \in 0...(i-1) (a[k] := b[k]) \wedge i > |b|$
 $\Leftrightarrow \quad \langle i > |b| \text{and } i \le (|b|+1) \text{ with some calculation} \rangle$
 $a, b \in String \wedge \forall k \in 0... |b| (a[k] := b[k])$
 $\Rightarrow \quad \langle \text{Definition of two string equal} \rangle$
 $a, b \in String \wedge a = b$

String Compare

Missing part

1 Task 1

Since we have define some manipulation of String, we can see a string as a whole. So the input is an array of String. Hence we can define our precondiction as:

$$a, b \in String^* \land |a| = n$$

As the post condition as:

$$\forall i < n \, (a[i] = b[m(i)])$$

Where m is a mapping function, define as follow:

sss

2 Task 2

We propose the following proof outline to demonstrate the correctness of our code (in black).

```
\{a, b \in String^* \land |a| = n\}
                                                                                                             (1)
\{I[^{0}/_{i}][^{0}/_{j}]\}
                                                                                                             (2)
i := 0; j := 0;
                                                                                                             (3)
\{J\}
                                                                                                             (4)
if |a| > 0 then
                                                                                                             (5)
      \{J \wedge |a| > 0\}
                                                                                                             (6)
      \{I[^1/_j][^1/_i][^{b:0\mapsto a[0]}/_b]\}
                                                                                                             (7)
      b[0] := a[0];
                                                                                                             (8)
      \{I[^{0}/_{i}][^{0}/_{j}]\}
                                                                                                             (9)
      i = 1; j = 1;
                                                                                                           (10)
\mathbf{fi}
                                                                                                           (11)
\{I\}
                                                                                                           (12)
while i < |a| do
                                                                                                           (13)
      \{I \wedge i < |a|\}
                                                                                                           (14)
      \{K\}
                                                                                                           (15)
      if a[i] \neq a[i+1] then
                                                                                                           (16)
            \{K \land a[i] \neq a[i+1]\}
                                                                                                           (17)
